The Information in Option Strike Price Introductions

Job Market Paper

Abstract: This paper shows that options market information slowly flows into the stock market through the introduction of options with new strike prices. The results imply option introductions contain long-term information about the underlying stock. Stocks with options introduced above the prevailing range of strike prices outperform those with new options introduced below the prevailing range of strike prices by up to 6% over the following 12 months. The results are not explained by standard risk factors, including short-term stock-price reversal and momentum. The results suggest informed investors with private information drive the introduction of new strike prices to enable cost-effective leverage.

Narrative Momentum

with Xiaoxia Lou, Gideon Ozik, Ronnie Sadka

Abstract: This paper documents attention momentum in economic narratives. Using a vast dataset of more than 150k digital media sources since 2013, roughly 350 narratives are quantified, and corresponding narrative-mimicking, long-short portfolios are constructed using stock return narrative betas. Narrative-mimicking portfolios of recently trending narratives outperform those of descending attention by about 7% annually, controlling for standard risk factors. Attention momentum is not attributed to price momentum in narratives and factors. Evidence suggests that attention momentum is driven by investor underreaction to economic narratives.
